

Height Growth Potential

Equipment & Nutrition Guide for Teens

Maximizing Natural Height Through Spinal Decompression & HGH Stimulation

Section 1: Decompression Equipment (Safe & Foldable)

ZENOVA Foldable Pull-Up Station	PRx Profile PRO Squat Rack	Teeter FitSpine X1 Inversion Table
Type: Freestanding Floor Space: 52.4" L × 33.1" W (Folds to 14.6" L) Routine: The Dead Hang (3 sets of 30–45 seconds) How it helps: Hanging straight down reverses daily gravity compression on spinal discs, allowing the spine to fully expand and maximizing standing postural height.	Type: Wall-Mounted (No floor drilling) Floor Space: 29.25" L × 53" W (Folds to 11.25" L) Routine: Resistance Core & Hangs How it helps: Supports heavy lifting to trigger natural spikes in Human Growth Hormone (HGH) and builds the core strength needed to prevent height-robbing slouching.	Type: Freestanding Floor Space: 81.0" L × 28.8" W (Folds to 20.0" L) Routine: Inverted Decompression (3–5 minutes at 30–60° angle) How it helps: Provides the deepest possible stretch to the spine and lower body joints, hydrating the spinal discs with fluid to maximize intervertebral space.

Section 2: Essential Nutritional Support (The Building Blocks)

High-Quality Protein

Influences **IGF-1**, the primary hormone for longitudinal bone growth. Eat lean meats, eggs, and dairy.

Vitamin D3 + Calcium

Calcium builds bone, but the body needs **D3** to absorb it.

Zinc

Mild zinc deficiency is clinically linked to stalled physical growth in teens.

Sleep — The Ultimate Supplement

80% of natural **HGH** is released during deep sleep. **8 to 9 hours** is mandatory.

Consult a healthcare provider before starting any new exercise or supplement routine. Genetics remain the primary factor in height potential.
